**Language:** English **Document Type:** ARTICLE

**Abstract:** Cell **transplantation** has emerged as an experimental approach to  
restore brain function after **stroke**. Various cell types including  
porcine fetal cells, **stem cells**, immortalized cell lines, and  
marrow stromal cells are under investigation in experimental and  
clinical **stroke** trials. This review discusses the unique advantages  
and limitations of the different graft sources and emphasizes the  
current, limited knowledge about their biology. The survival,  
integration, and efficacy of neural **transplants** in **stroke** patients  
will depend on the type, severity, chronicity, adequacy of circulation,  
and location of the **stroke** lesion.
